Angular Front End – Django Back end web site project

Take your UML subject or MongoDB project subject and use it in order to develop a website using **Angular as front End and Django as backend.**

1. **Use Mongoose and MongoDB** to Create tables with Primary and Foreign Keys. Explain your **models in the report.**
 - Design and create the model classes using Foreign keys, ManytoMany fields.
 - Create fields of type: Email, Date, File PDF, File Image.
2. **Create a website allowing you:**
 - User authentication
 - **Retrieving** data according to search criteria . **Ordering** data.
 - Updating and deleting data.
 - Searching some data according to some criteria.
 - Link between tables
 - Link between pages
 - Uploading an Image and a Document – Viewing the attached document/image
3. **Use Angular concepts:**
 - Use Angular validators.
 - Use Angular Reactive Forms
 - Use Angular Routing

Remarks

- **DON'T COPY** an existing subject or website from the Internet. Avoid subject like order on line, books, etc.
- If you were groups working on the same subject, **distribute tables** (at least 2 tables per student). Each student will be responsible for his pages (models, forms, views, templates, URLs, etc.). Each student should develop a Django Model (+tables) and Front End pages to manipulate these tables.
- Each student must bring his **own laptop** for presentation.
- Prepare a common **word** document (5 pages maximum) resuming the options used in your site as **models** description, your **app/components structure in the report, your urls.** Don't forget to list **tasks repartition per student in the report** (precising students name and number).
- Check the Excel file to know your group XX number. **XX: group ID on two digits.**
- **Assignment delivery:**
 - Attach your code as a **zip** file using this standard: **BXX_AngularDjango**
 - A **Word** document named: **BXX_AngularDjango_Report**
- You will be responsible for executing the web site and answering questions on code source during the presentation.
